## TITLE

1,3-BENZODIAZEPIN-2-ONES AND 1,3-BENZOXAZEPIN-2-ONES USEFUL  
AS HIV REVERSE TRANSCRIPTASE INHIBITORS

10

## FIELD OF THE INVENTION

This invention relates generally to 1,3-benzodiazepin-  
2-ones and 1,3-benzoxazepin-2-ones which are useful as  
inhibitors of HIV reverse transcriptase, pharmaceutical  
compositions and diagnostic kits comprising the same,  
15 methods of using the same for treating viral infection or as  
assay standards or reagents, and intermediates and processes  
for making the same.

## BACKGROUND OF THE INVENTION

20

Two distinct retroviruses, human immunodeficiency virus  
(HIV) type-1 (HIV-1) or type-2 (HIV-2), have been  
etiologically linked to the immunosuppressive disease,  
acquired immunodeficiency syndrome (AIDS). HIV seropositive  
individuals are initially asymptomatic but typically develop  
25 AIDS related complex (ARC) followed by AIDS. Affected  
individuals exhibit severe immunosuppression which  
predisposes them to debilitating and ultimately fatal  
opportunistic infections.

30

The disease AIDS is the end result of an HIV-1 or HIV-2  
virus following its own complex life cycle. The virion life  
cycle begins with the virion attaching itself to the host  
human T-4 lymphocyte immune cell through the bonding of a  
glycoprotein on the surface of the virion's protective coat  
with the CD4 glycoprotein on the lymphocyte cell. Once  
35 attached, the virion sheds its glycoprotein coat, penetrates  
into the membrane of the host cell, and uncoats its RNA.  
The virion enzyme, reverse transcriptase, directs the  
process of transcribing the RNA into single-stranded DNA.  
The viral RNA is degraded and a second DNA strand is  
40 created. The now double-stranded DNA is integrated into the

5 human cell's genes and those genes are used for virus reproduction.

At this point, RNA polymerase transcribes the integrated DNA into viral RNA. The viral RNA is translated into the precursor *gag-pol* fusion polyprotein. The  
10 polyprotein is then cleaved by the HIV protease enzyme to yield the mature viral proteins. Thus, HIV protease is responsible for regulating a cascade of cleavage events that lead to the virus particle's maturing into a virus that is capable of full infectivity.

15 The typical human immune system response, killing the invading virion, is taxed because the virus infects and kills the immune system's T cells. In addition, viral reverse transcriptase, the enzyme used in making a new virion particle, is not very specific, and causes  
20 transcription mistakes that result in continually changed glycoproteins on the surface of the viral protective coat. This lack of specificity decreases the immune system's effectiveness because antibodies specifically produced against one glycoprotein may be useless against another,  
25 hence reducing the number of antibodies available to fight the virus. The virus continues to reproduce while the immune response system continues to weaken. Eventually, the HIV largely holds free reign over the body's immune system, allowing opportunistic infections to set in and without the  
30 administration of antiviral agents, immunomodulators, or both, death may result.

There are at least three critical points in the virus's life cycle which have been identified as possible targets for antiviral drugs: (1) the initial attachment of the  
35 virion to the T-4 lymphocyte or macrophage site, (2) the transcription of viral RNA to viral DNA (reverse transcriptase, RT), and (3) the processing of *gag-pol* protein by HIV protease.

Inhibition of the virus at the second critical point,  
40 the viral RNA to viral DNA transcription process, has

5 provided a number of the current therapies used in treating  
AIDS. This transcription must occur for the virion to  
reproduce because the virion's genes are encoded in RNA and  
the host cell reads only DNA. By introducing drugs that  
block the reverse transcriptase from completing the  
10 formation of viral DNA, HIV-1 replication can be stopped.

A number of compounds that interfere with viral  
replication have been developed to treat AIDS. For example,  
nucleoside analogs, such as 3'-azido-3'-deoxythymidine  
(AZT), 2',3'-dideoxycytidine (ddC), 2',3'-dideoxythymidine  
15 (d4T), 2',3'-dideoxyinosine (ddI), and 2',3'-dideoxy-3'-  
thia-cytidine (3TC) have been shown to be relatively  
effective in halting HIV replication at the reverse  
transcriptase (RT) stage.

An active area of research is in the discovery of non-  
20 nucleoside HIV reverse transcriptase inhibitors. As an  
example, it has been found that certain benzoxazinones and  
quinazolinones are active in the inhibition of HIV reverse  
transcriptase, the prevention or treatment of infection by  
HIV and the treatment of AIDS.

25 U.S. 5,519,021 describe reverse transcriptase  
inhibitors which are benzoxazinones of the formula:

wherein X is a halogen, Z may be O.

EP 0,530,994 and WO 93/04047 describe HIV reverse  
30 transcriptase inhibitors which are quinazolinones of the  
formula A:

5

A

wherein G is a variety of groups, R<sup>3</sup> and R<sup>4</sup> may be H, Z may be O, R<sup>2</sup> may be unsubstituted alkyl, unsubstituted alkenyl, unsubstituted alkynyl, unsubstituted cycloalkyl, unsubstituted heterocycle, and optionally substituted aryl, and R<sup>1</sup> may be a variety of groups including substituted alkyl.

WO 95/12583 also describes HIV reverse transcriptase inhibitors of formula A. In this publication, G is a variety of groups, R<sup>3</sup> and R<sup>4</sup> may be H, Z may be O, R<sup>2</sup> is substituted alkenyl or substituted alkynyl, and R<sup>1</sup> is cycloalkyl, alkynyl, alkenyl, or cyano. WO 95/13273 illustrates the asymmetric synthesis of one of the compounds of WO 95/12583, (S)-(-)-6-chloro-4-cyclopropyl-3,4-dihydro-4((2-pyridyl)ethynyl)-2(1H)-quinazolinone.

Synthetic procedures for making quinazolinones like those described above are detailed in the following references: Houpis et al, *Tetr. Lett.* **1994**, 35(37), 6811-6814; Tucker et al, *J. Med. Chem.* **1994**, 37, 2437-2444; and, Huffman et al, *J. Org. Chem.* **1995**, 60, 1590-1594.

DE 4,320,347 illustrates quinazolinones of the formula:

wherein R is a phenyl, carbocyclic ring, or a heterocyclic ring. Compounds of this sort are not considered to be part of the present invention.

Even with the current success of reverse transcriptase inhibitors, it has been found that HIV patients can become resistant to a single inhibitor. Thus, it is desirable to develop additional inhibitors to further combat HIV infection.

## SUMMARY OF THE INVENTION

Accordingly, one object of the present invention is to provide novel reverse transcriptase inhibitors.

It is another object of the present invention to provide a novel method of treating HIV infection which comprises administering to a host in need of such treatment a therapeutically effective amount of at least one of the compounds of the present invention or a pharmaceutically acceptable salt form thereof.

It is another object of the present invention to provide a novel method of treating HIV infection which comprises administering to a host in need thereof a therapeutically effective combination of (a) one of the compounds of the present invention and (b) one or more compounds selected from the group consisting of HIV reverse transcriptase inhibitors and HIV protease inhibitors.

It is another object of the present invention to provide pharmaceutical compositions with reverse transcriptase inhibiting activity comprising a pharmaceutically acceptable carrier and a therapeutically effective amount of at least one of the compounds of the present invention or a pharmaceutically acceptable salt form thereof.

It is another object of the present invention to provide a method of inhibiting HIV present in a body fluid sample which comprises treating the body fluid sample with an effective amount of a compound of the present invention.

It is another object of the present invention to provide a kit or container containing at least one of the compounds of the present invention in an amount effective for use as a standard or reagent in a test or assay for determining the ability of a potential pharmaceutical to inhibit HIV reverse transcriptase, HIV growth, or both.

It is another object of the present invention to provide novel compounds for use in therapy.

5 It is another object of the present invention to provide the use of novel compounds for the manufacture of a medicament for the treatment of HIV.

These and other objects, which will become apparent during the following detailed description, have been  
10 achieved by the inventors' discovery that compounds of formula (I):

I

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, X, and Y are defined below,  
15 stereoisomeric forms, mixtures of stereoisomeric forms, or pharmaceutically acceptable salt forms thereof, are effective reverse transcriptase inhibitors.

#### DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

20 [1] Thus, in an embodiment, the present invention provides a novel compound of formula I:

I

25 or a stereoisomer or pharmaceutically acceptable salt form thereof, wherein:

A is O or S;

30 B is selected from O, S, and NR<sup>8</sup>;

W is N or CR<sup>3</sup>;

X is N or CR<sup>3a</sup>;

5

Y is N or CR<sup>3b</sup>;

Z is N or CR<sup>3c</sup>;

10 provided that if two of W, X, Y, and Z are N, then the remaining are other than N;

R<sup>1</sup> is selected from the group C<sub>1-3</sub> alkyl substituted with 0-7 halogen and cyclopropyl;

15

R<sup>2</sup> is selected from the group -R<sup>2c</sup>, -OR<sup>2c</sup>, -OCHR<sup>2a</sup>R<sup>2b</sup>,  
-OCH<sub>2</sub>CHR<sup>2a</sup>R<sup>2b</sup>, -O(CH<sub>2</sub>)<sub>2</sub>CHR<sup>2a</sup>R<sup>2b</sup>, -OCHR<sup>2a</sup>C=C-R<sup>2b</sup>,  
-OCHR<sup>2a</sup>C=R<sup>2c</sup>, -OCHR<sup>2a</sup>C≡C-R<sup>2b</sup>, -SR<sup>2c</sup>, -SCHR<sup>2a</sup>R<sup>2b</sup>,  
-SCH<sub>2</sub>CHR<sup>2a</sup>R<sup>2b</sup>, -S(CH<sub>2</sub>)<sub>2</sub>CHR<sup>2a</sup>R<sup>2b</sup>, -SCHR<sup>2a</sup>C=C-R<sup>2b</sup>,  
20 -SCHR<sup>2a</sup>C=R<sup>2c</sup>, -SCHR<sup>2a</sup>C≡C-R<sup>2b</sup>, -NR<sup>2a</sup>R<sup>2c</sup>, -NHCHR<sup>2a</sup>R<sup>2b</sup>,

-NHCHR<sup>2a</sup>C=R<sup>2c</sup>, and -NHCHR<sup>2a</sup>C≡C-R<sup>2b</sup>;

25

R<sup>2a</sup> is selected from the group H, CH<sub>3</sub>, CH<sub>2</sub>CH<sub>3</sub>, CH(CH<sub>3</sub>)<sub>2</sub>, and CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>;

R<sup>2b</sup> is H or R<sup>2c</sup>;

R<sup>2c</sup> is selected from the group C<sub>1-6</sub> alkyl substituted with  
30 0-2 R<sup>4</sup>, C<sub>2-5</sub> alkenyl substituted with 0-2 R<sup>4</sup>, C<sub>2-5</sub>  
alkynyl substituted with 0-1 R<sup>4</sup>, C<sub>3-6</sub> cycloalkyl  
substituted with 0-2 R<sup>3d</sup>, phenyl substituted with 0-2  
R<sup>3d</sup>, and 3-6 membered heterocyclic group containing 1-3  
heteroatoms selected from the group O, N, and S,  
35 substituted with 0-2 R<sup>3d</sup>;

5 alternatively, the group  $-NR^{2a}R^{2c}$  represents a 4-7 membered cyclic amine, wherein 0-1 carbon atoms are replaced by O or  $NR^5$ ;

$R^3$  is selected from the group H,  $C_{1-4}$  alkyl, -OH,  $C_{1-4}$   
10 alkoxy,  $OCF_3$ , F, Cl, Br, I,  $-NR^5R^{5a}$ ,  $-NO_2$ ,  $-CN$ ,  $-C(O)R^6$ ,  
 $-NHC(O)R^7$ ,  $-NHC(O)NR^5R^{5a}$ ,  $-NHSO_2R^{10}$ ,  $-SO_2NR^5R^{5a}$ , and a  
5-6 membered heteroaromatic ring containing 1-4  
heteroatoms selected from the group O, N, and S;

15  $R^{3a}$  is selected from the group H,  $C_{1-4}$  alkyl, -OH,  $C_{1-4}$   
alkoxy,  $OCF_3$ , F, Cl, Br, I,  $-NR^5R^{5a}$ ,  $-NO_2$ ,  $-CN$ ,  $-C(O)R^6$ ,  
 $-NHC(O)R^7$ ,  $-NHC(O)NR^5R^{5a}$ ,  $-NHSO_2R^{10}$ ,  $-SO_2NR^5R^{5a}$ , and a  
5-6 membered heteroaromatic ring containing 1-4  
heteroatoms selected from the group O, N, and S;

20

alternatively,  $R^3$  and  $R^{3a}$  together form  $-OCH_2O-$ ;

$R^{3b}$  is selected from the group H,  $C_{1-4}$  alkyl, -OH,  $C_{1-4}$   
alkoxy,  $OCF_3$ , F, Cl, Br, I,  $-NR^5R^{5a}$ ,  $-NO_2$ ,  $-CN$ ,  $-C(O)R^6$ ,  
25  $-NHC(O)R^7$ ,  $-NHC(O)NR^5R^{5a}$ ,  $-NHSO_2R^{10}$ , and  $-SO_2NR^5R^{5a}$ ;

alternatively,  $R^{3a}$  and  $R^{3b}$  together form  $-OCH_2O-$ ;

$R^{3c}$  is selected from the group H,  $C_{1-4}$  alkyl, -OH,  $C_{1-4}$   
30 alkoxy,  $OCF_3$ , F, Cl, Br, I,  $-NR^5R^{5a}$ ,  $-NO_2$ ,  $-CN$ ,  $-C(O)R^6$ ,

      containing 1-3 heteroatoms selected from the group O,  
      N, and S, substituted with 0-3 R<sup>3f</sup>; and,  
25

      R<sup>4</sup> is selected from the group F, Cl, Br, I, C<sub>1-6</sub> alkyl  
      substituted with 0-2 R<sup>3e</sup>, C<sub>3-10</sub> carbocycle substituted  
      with 0-2 R<sup>3e</sup>, phenyl substituted with 0-5 R<sup>3e</sup>, and a  
      5-10 membered heterocyclic group containing 1-3  
30        heteroatoms selected from the group O, N, and S,  
      substituted with 0-2 R<sup>3e</sup>;

      R<sup>5</sup> and R<sup>5a</sup> are independently selected from the group H and  
      C<sub>1-4</sub> alkyl;

35

5 alternatively,  $R^5$  and  $R^{5a}$ , together with the nitrogen to  
which they are attached, combine to form a 5-6 membered  
ring containing 0-1 O or N atoms;

$R^6$  is selected from the group H, OH,  $C_{1-4}$  alkyl,  $C_{1-4}$  alkoxy,  
10 and  $NR^5R^{5a}$ ;

$R^7$  is selected from the group  $C_{1-3}$  alkyl and  $C_{1-3}$  alkoxy;

$R^8$  is selected from the group H,  $OR^9$ ,  $SR^9$ ,  $NR^5R^9$ ,  $C_{1-6}$  alkyl  
15 substituted with 0-3  $R^{3g}$ ,  $C_{2-6}$  alkenyl substituted with  
0-3  $R^{3g}$ ,  $C_{2-6}$  alkynyl substituted with 0-3  $R^{3g}$ ,  $C_{3-5}$   
cycloalkyl substituted with 0-2  $R^{3f}$ , phenyl substituted  
with 0-5  $R^{3f}$ , and a 5-6 membered heterocyclic group  
containing 1-3 heteroatoms selected from the group O,  
20 N, and S, substituted with 0-2  $R^{3f}$ ;

$R^9$  is selected from the group  $C_{3-10}$  carbocycle substituted  
with 0-5  $R^{3f}$  and a 5-10 membered heterocyclic group  
containing 1-3 heteroatoms selected from the group O,  
25 N, and S, substituted with 0-2  $R^{3f}$ ; and,

$R^{10}$  is selected from the group  $C_{1-4}$  alkyl and phenyl.

30 [2] In a preferred embodiment, the present invention  
provides a novel compound of formula I, wherein:

B is  $NR^8$ ;

35  $R^1$  is selected from the group  $C_{1-3}$  alkyl substituted with 1-7  
halogen and cyclopropyl;

5  $R^2$  is selected from the group  $-R^{2c}$ ,  $-OR^{2c}$ ,  $-OCHR^{2a}R^{2b}$ ,  
     $-OCH_2CHR^{2a}R^{2b}$ ,  $-O(CH_2)_2CHR^{2a}R^{2b}$ ,  $-OCHR^{2a}C=C-R^{2b}$ ,

In another embodiment, the present invention provides a  
novel pharmaceutical composition comprising a  
pharmaceutically acceptable carrier and a therapeutically  
35 effective amount of a compound of formula I or  
pharmaceutically acceptable salt form thereof.

In another embodiment, the present invention provides a  
40 novel method of treating HIV infection which comprises

5 administering to a host in need of such treatment a therapeutically effective amount of a compound of formula I or pharmaceutically acceptable salt form thereof.

10 In another embodiment, the present invention provides a novel method of treating HIV infection which comprises administering, in combination, to a host in need thereof a therapeutically effective amount of:

- (a) a compound of formula I; and,
- 15 (b) at least one compound selected from the group consisting of HIV reverse transcriptase inhibitors and HIV protease inhibitors.

20 In another preferred embodiment, the reverse transcriptase inhibitor is selected from the group AZT, ddC, ddI, d4T, 3TC, DPC082, DPC083, DPC961, DPC963, AG1549 delavirdine, efavirenz, nevirapine, Ro 18,893, trovirdine, MKC-442, HBY 097, ACT, UC-781, UC-782, RD4-2025, and MEN  
25 10979, and the protease inhibitor is selected from the group saquinavir, ritonavir, indinavir, amprenavir, nelfinavir, palinavir, BMS-232623, GS3333, KNI-413, KNI-272, LG-71350, CGP-61755, PD 173606, PD 177298, PD 178390, PD 178392, U-140690, and ABT-378.

30

In an even more preferred embodiment, the reverse transcriptase inhibitor is selected from the group AZT, efavirenz, and 3TC and the protease inhibitor is selected  
35 from the group saquinavir, ritonavir, nelfinavir, and indinavir.

In a still further preferred embodiment, the reverse  
40 transcriptase inhibitor is AZT.

5

In another still further preferred embodiment, the protease inhibitor is indinavir.

10

In another embodiment, the present invention provides a pharmaceutical kit useful for the treatment of HIV infection, which comprises a therapeutically effective amount of:

15

(a) a compound of formula I or a pharmaceutically acceptable salt form thereof; and,

(b) at least one compound selected from the group consisting of HIV reverse transcriptase inhibitors and HIV protease inhibitors, in one or more sterile containers.

20

In another embodiment, the present invention provides novel compounds of formula I or pharmaceutically acceptable salt forms thereof for use in therapy.

25

In another embodiment, the present invention provides the use of novel compounds of formula I or pharmaceutically acceptable salt forms thereof for the manufacture of a medicament for the treatment of HIV.

#### DEFINITIONS

The compounds herein described may have asymmetric centers. Compounds of the present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis from optically active starting materials. Geometric isomers of double bonds such as olefins and C=N double bonds can also be present in the

40

5 compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric,  
10 racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomeric form is specifically indicated. All processes used to prepare compounds of the present invention and intermediates made therein are considered to be part of the  
15 present invention.

The term "substituted," as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency is not exceeded, and that  
20 the substitution results in a stable compound. When a substituent is keto (i.e., =O), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties. When a ring system (e.g., carbocyclic or heterocyclic) is said to be substituted with a carbonyl  
25 group or a double bond, it is intended that the carbonyl group or double bond be part (i.e., within) of the ring.

The present invention is intended to include all isotopes of atoms occurring in the present compounds. Isotopes include those atoms having the same atomic number  
30 but different mass numbers. By way of general example and without limitation, isotopes of hydrogen include tritium and deuterium. Isotopes of carbon include C-13 and C-14.

When any variable (e.g.,  $R^6$ ) occurs more than one time in any constituent or formula for a compound, its definition  
35 at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-2  $R^6$ , then said group may optionally be substituted with up to two  $R^6$  groups and  $R^6$  at each occurrence is selected independently from the definition of

5 R<sup>6</sup>. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be  
10 bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of substituents and/or  
15 variables are permissible only if such combinations result in stable compounds.

As used herein, "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon  
20 atoms. C<sub>1-6</sub> alkyl (or alkylene), is intended to include C<sub>1</sub>, C<sub>2</sub>, C<sub>3</sub>, C<sub>4</sub>, C<sub>5</sub>, and C<sub>6</sub> alkyl groups. Examples of alkyl include, but are not limited to, methyl, ethyl, n-propyl, i-propyl, n-butyl, s-butyl, t-butyl, n-pentyl, and s-pentyl. "Haloalkyl" is intended to include both branched and  
25 straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms, substituted with 1 or more halogen (for example -C<sub>v</sub>F<sub>w</sub> where v = 1 to 3 and w = 1 to (2v+1)). Examples of haloalkyl include, but are not limited to, trifluoromethyl, trichloromethyl, pentafluoroethyl, and  
30 pentachloroethyl. "Alkoxy" represents an alkyl group as defined above with the indicated number of carbon atoms attached through an oxygen bridge. C<sub>1-10</sub> alkoxy, is intended to include C<sub>1</sub>, C<sub>2</sub>, C<sub>3</sub>, C<sub>4</sub>, C<sub>5</sub>, C<sub>6</sub>, C<sub>7</sub>, C<sub>8</sub>, C<sub>9</sub>, and C<sub>10</sub> alkoxy groups. Examples of alkoxy include, but are not limited to,  
35 methoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, s-butoxy, t-butoxy, n-pentoxy, and s-pentoxy. "Cycloalkyl" is intended to include saturated ring groups, such as cyclopropyl, cyclobutyl, or cyclopentyl. C<sub>3-10</sub> cycloalkyl, is intended to include C<sub>3</sub>, C<sub>4</sub>, C<sub>5</sub>, C<sub>6</sub>, C<sub>7</sub>, C<sub>8</sub>, C<sub>9</sub>, and C<sub>10</sub>

5 cycloalkyl groups. "Alkenyl" or "alkenylene" is intended to include hydrocarbon chains of either a straight or branched configuration and one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain, such as ethenyl and propenyl. C<sub>2-6</sub> alkenyl (or alkenylene),  
10 is intended to include C<sub>2</sub>, C<sub>3</sub>, C<sub>4</sub>, C<sub>5</sub>, and C<sub>6</sub> alkenyl groups. "Alkynyl" or "alkynylene" is intended to include hydrocarbon chains of either a straight or branched configuration and one or more triple carbon-carbon bonds which may occur in any stable point along the chain, such as ethynyl and  
15 propynyl. C<sub>2-6</sub> alkynyl (or alkynylene), is intended to include C<sub>2</sub>, C<sub>3</sub>, C<sub>4</sub>, C<sub>5</sub>, and C<sub>6</sub> alkynyl groups.

"Halo" or "halogen" as used herein refers to fluoro, chloro, bromo, and iodo; and "counterion" is used to represent a small, negatively charged species such as  
20 chloride, bromide, hydroxide, acetate, and sulfate.

As used herein, "carbocycle" or "carbocyclic group" is intended to mean any stable 3, 4, 5, 6, or 7-membered monocyclic or bicyclic or 7, 8, 9, or 10-membered bicyclic or tricyclic, any of which may be saturated, partially  
25 unsaturated, or aromatic. Examples of such carbocycles include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, adamantyl, cyclooctyl, [3.3.0]bicyclooctane, [4.3.0]bicyclononane, [4.4.0]bicyclodecane, [2.2.2]bicyclooctane, fluorenyl,  
30 phenyl, naphthyl, indanyl, adamantyl, and tetrahydronaphthyl.

As used herein, the term "heterocycle" or "heterocyclic group" is intended to mean a stable 5, 6, or 7-membered monocyclic or bicyclic or 7, 8, 9, or 10-membered bicyclic  
35 heterocyclic ring which is saturated, partially unsaturated or unsaturated (aromatic), and which consists of carbon atoms and 1, 2, 3, or 4 heteroatoms independently selected from the group consisting of N, NH, O and S and including any bicyclic group in which any of the above-defined

5 heterocyclic rings is fused to a benzene ring. The nitrogen and sulfur heteroatoms may optionally be oxidized. The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom which results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a nitrogen atom if the resulting compound is stable. A nitrogen in the heterocycle may optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1. As used herein, the term "aromatic heterocyclic group" or "heteroaryl" is intended to mean a stable 5, 6, or 7-membered monocyclic or bicyclic or 7, 8, 9, or 10-membered bicyclic heterocyclic aromatic ring which consists of carbon atoms and 1, 2, 3, or 4 heteroatoms independently selected from the group consisting of N, NH, O and S. It is to be noted that total number of S and O atoms in the aromatic heterocycle is not more than 1.

Examples of heterocycles include, but are not limited to, acridinyl, azocinyl, benzimidazolyl, benzofuranyl, benzothiofuranyl, benzothiophenyl, benzoxazolyl, benzthiazolyl, benztriazolyl, benztetrazolyl, benzisoxazolyl, benzisothiazolyl, benzimidazolinyl, carbazolyl, 4aH-carbazolyl, carbolinyl, chromanyl, chromenyl, cinnolinyl, decahydroquinolinyl, 2H,6H-1,5,2-dithiazinyl, dihydrofuro[2,3-b]tetrahydrofuran, furanyl, furazanyl, imidazolidinyl, imidazolinyl, imidazolyl, 1H-indazolyl, indolenyl, indolinyl, indolizinyl, indolyl, 3H-indolyl, isobenzofuranyl, isochromanyl, isoindazolyl, isoindolinyl, isoindolyl, isoquinolinyl, isothiazolyl, isoxazolyl, methylenedioxyphenyl, morpholinyl, naphthyridinyl, octahydroisoquinolinyl, oxadiazolyl, 1,2,3-oxadiazolyl, 1,2,4-oxadiazolyl, 1,2,5-oxadiazolyl, 1,3,4-oxadiazolyl, oxazolidinyl, oxazolyl, oxazolidinyl, pyrimidinyl, phenanthridinyl, phenanthrolinyl, phenazinyl,

5 phenothiazinyl, phenoxathiinyl, phenoxazinyl, phthalazinyl,  
piperazinyl, piperidinyl, piperidonyl, 4-piperidonyl,  
piperonyl, pteridinyl, purinyl, pyranyl, pyrazinyl,  
pyrazolidinyl, pyrazolinyl, pyrazolyl, pyridazinyl,  
pyridooxazole, pyridoimidazole, pyridothiazole, pyridinyl,  
10 pyridyl, pyrimidinyl, pyrrolidinyl, pyrrolinyl, 2H-pyrrolyl,  
pyrrolyl, quinazolinyl, quinolinyl, 4H-quinolizinyll,  
quinoxalinyl, quinuclidinyl, tetrahydrofuranyl,  
tetrahydroisoquinolinyl, tetrahydroquinolinyl, tetrazolyl,  
6H-1,2,5-thiadiazinyl, 1,2,3-thiadiazolyl, 1,2,4-  
15 thiadiazolyl, 1,2,5-thiadiazolyl, 1,3,4-thiadiazolyl,  
thianthrenyl, thiazolyl, thienyl, thienothiazolyl,  
thienooxazolyl, thienoimidazolyl, thiophenyl, triazinyl,  
1,2,3-triazolyl, 1,2,4-triazolyl, 1,2,5-triazolyl, 1,3,4-  
triazolyl, and xanthenyl. Preferred heterocycles include,  
20 but are not limited to, pyridinyl, furanyl, thienyl,  
pyrrolyl, pyrazolyl, pyrrolidinyl, imidazolyl, indolyl,  
benzimidazolyl, 1H-indazolyl, oxazolidinyl, benztriazolyl,  
benzisoxazolyl, oxindolyl, benzoxazolinyl, and isatinoyl.  
Also included are fused ring and spiro compounds containing,  
25 for example, the above heterocycles.

As used herein, "HIV reverse transcriptase inhibitor"  
is intended to refer to both nucleoside and non-nucleoside  
inhibitors of HIV reverse transcriptase (RT). Examples of  
nucleoside RT inhibitors include, but are not limited to,  
30 AZT, ddC, ddI, d4T, and 3TC. Also included is Glaxo's  
combination of AZT and 3TC. Examples of non-nucleoside RT  
inhibitors include, but are no limited to, DPC082 (DuPont,  
(+)-4-Cyclopropylethenyl-5,6-difluoro-4-trifluoromethyl-3,4-  
dihydro-2(1H)-quinazolinone), DPC083 (DuPont, (-)-6-chloro-  
35 4-E-cyclopropylethenyl-4-trifluoromethyl-3,4-dihydro-2(1H)-  
quinazolinone), DPC961 (DuPont, (-)-6-chloro-4-  
cyclopropylethynyl-4-trifluoromethyl-3,4-dihydro-2(1H)-  
quinazolinone), DPC963 (DuPont, (+)-4-Cyclopropylethynyl-  
5,6-difluoro-4-trifluoromethyl-3,4-dihydro-2(1H)-  
40 quinazolinone), AG1549 (Warner Lambert/Shionogi),

5 delavirdine (Pharmacia and Upjohn U90152S), efavirenz  
(DuPont), nevirapine (Boehringer Ingelheim), Ro 18,893  
(Roche), trovirdine (Lilly), MKC-442 (Triangle), HBY 097  
(Hoechst), ACT (Korean Research Institute), UC-781 (Rega  
Institute), UC-782 (Rega Institute), RD4-2025 (Tosoh Co.  
10 Ltd.), and MEN 10979 (Menarini Farmaceutici).

The phrase "pharmaceutically acceptable" is employed  
herein to refer to those compounds, materials, compositions,  
and/or dosage forms which are, within the scope of sound  
medical judgment, suitable for use in contact with the  
15 tissues of human beings and animals without excessive  
toxicity, irritation, allergic response, or other problem or  
complication, commensurate with a reasonable benefit/risk  
ratio.

As used herein, "pharmaceutically acceptable salts"  
20 refer to derivatives of the disclosed compounds wherein the  
parent compound is modified by making acid or base salts  
thereof. Examples of pharmaceutically acceptable salts  
include, but are not limited to, mineral or organic acid  
salts of basic groups such as amines; and alkali or organic  
25 salts of acidic groups such as carboxylic acids. The  
pharmaceutically acceptable salts include the conventional  
non-toxic salts or the quaternary ammonium salts of the  
parent compound formed, for example, from non-toxic  
inorganic or organic acids. For example, such conventional  
30 non-toxic salts include those derived from inorganic acids  
such as hydrochloric, hydrobromic, sulfuric, sulfamic,  
phosphoric, and nitric; and the salts prepared from organic  
acids such as acetic, propionic, succinic, glycolic,  
stearic, lactic, malic, tartaric, citric, ascorbic, pamoic,  
35 maleic, hydroxymaleic, phenylacetic, glutamic, benzoic,  
salicylic, sulfanilic, 2-acetoxybenzoic, fumaric,  
toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic,  
and isethionic.

The pharmaceutically acceptable salts of the present  
40 invention can be synthesized from the parent compound which

5 contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two;  
10 generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, PA, 1985, p. 1418, the disclosure of which is hereby  
15 incorporated by reference.

Since prodrugs are known to enhance numerous desirable qualities of pharmaceuticals (e.g., solubility, bioavailability, manufacturing, etc...) the compounds of the present invention may be delivered in prodrug form. Thus,  
20 the present invention is intended to cover prodrugs of the presently claimed compounds, methods of delivering the same and compositions containing the same. "Prodrugs" are intended to include any covalently bonded carriers which release an active parent drug of the present invention in  
25 vivo when such prodrug is administered to a mammalian subject. Prodrugs of the present invention are prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine manipulation or in vivo, to the parent compound. Prodrugs  
30 include compounds of the present invention wherein a hydroxy, amino, or sulfhydryl group is bonded to any group that, when the prodrug of the present invention is administered to a mammalian subject, it cleaves to form a free hydroxyl, free amino, or free sulfhydryl group,  
35 respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of the present invention.

"Stable compound" and "stable structure" are meant to  
40 indicate a compound that is sufficiently robust to survive

5 isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

"Therapeutically effective amount" is intended to include an amount of a compound of the present invention or  
10 an amount of the combination of compounds claimed effective to inhibit HIV infection or treat the symptoms of HIV infection in a host. The combination of compounds is preferably a synergistic combination. Synergy, as described for example by Chou and Talalay, Adv. Enzyme Regul. 22:27-55  
15 (1984), occurs when the effect (in this case, inhibition of HIV) of the compounds when administered in combination is greater than the additive effect of the compounds when administered alone as a single agent. In general, a synergistic effect is most clearly demonstrated at  
20 suboptimal concentrations of the compounds. Synergy can be in terms of lower cytotoxicity, increased antiviral effect, or some other beneficial effect of the combination compared with the individual components.

## 25 SYNTHESIS

The compounds of the present invention can be prepared in a number of ways well known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below,  
30 together with synthetic methods known in the art of synthetic organic chemistry, or variations thereon as appreciated by those skilled in the art. Preferred methods include but are not limited to those methods described below. Each of the references cited below are hereby  
35 incorporated herein by reference. In the Schemes which follow, R<sup>1</sup> is shown as a CF<sub>3</sub> group, but could be any one of the presently described R<sup>1</sup> groups.

## SCHEME 1

Scheme 1 illustrates a method of making  
 10 tetrahydroquinolinone intermediates. An appropriately  
 substituted amino-ketone is acylated and the resulting amide  
 cyclized in the presence of benzenesulfinate to give alcohol  
**1c**. Dehydration with base provides the  $\alpha,\beta$ -unsaturated  
 ketone **1d** which can be modified via a lithium or Grignard  
 15 reagent to give **2**. Sulfone reduction can be achieved with  
 $Al/Hg$  or other known methods of reduction to leave  
 intermediate **3**.

## SCHEME 2

5

Scheme 2 depicts modification of intermediate 3 into a 1,3-benzodiazepin-2-one. Compound 3 is protected as amide 4 using Boc-anhydride and ring opened to hydroxamide 5.

Lossen rearrangement and deprotection can then be

10 accomplished with tosyl chloride and based followed by trifluoroacetic acid to give the desired 1,3-benzodiazepin-2-one 6.

**SCHEME 3**

15

Scheme 3 illustrates a method of reducing acetylene 6 to cis-olefin 7 using NH<sub>2</sub>OSO<sub>3</sub>H and DIEA. Other methods known to reduce alkynes to alkenes could also be used. In Scheme 3 and the Schemes which follow, G can be R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> or a combination of two or more of these groups.

**SCHEME 4**

25

5

Thioureas of the present invention can be formed as shown in Scheme 4 from their corresponding ureas. Urea 6 is initially converted into a halo-imine via a chlorinating agent such as POCL<sub>3</sub> which is then further transformed into thiourea 8 with NH<sub>2</sub>C(S)NH<sub>2</sub>.

An alternative method of preparing compounds of the present invention is shown below in Scheme 5 and proceeds through a nitro-olefin intermediate.

15

SCHEME 5

Starting from appropriately substituted ketone 9, nitromethane is added and alkoxide 10 is quenched with a protecting group like TBS-Cl to provide silyl ether 11. Nitro-olefin 12 can be formed by heating 11 in the presence of a base (e.g., K<sub>2</sub>CO<sub>3</sub>). R<sup>2</sup> (e.g., butyl) can be attached via Grignard addition (e.g., BuMgCl), (R<sup>2</sup>)<sub>3</sub>Al addition (e.g.,

- 5 (cyclopropylethyl)<sub>3</sub>Al) or other known methods of addition to nitro-olefins. Modification to **14** can be achieved by reduction of the nitro group to an amino group, deprotection of the aniline amine and finally cyclization with a carbonyl reagent like CDI.

10

5

## SCHEME 6

10 An alternate means of preparing compounds of the present invention is presented in Scheme 6. The trifluoromethyl ketone is treated with diazomethane,

5 dimethylsulfonium methylide, or dimethylsulfoxonium  
methylide to give the epoxide. The epoxide is then reacted  
with a primary amine to give the ring opened alcohol which  
on treatment with N,N'-carbonyldiimidazole affords a mixture  
of 5- and 7-membered cyclic amides. Treatment of this  
10 mixture with sodium methoxide or triethylamine in ethanol  
converts it to the desired 7-membered cyclic urea. In  
addition to N,N'-carbonyldiimidazole, conversion to the  
cyclic urea can also be accomplished with phosgene,  
triphosgene, methylchloroformate or a number of similar  
15 reagents well-known to practitioners of the art. Treatment  
of the cyclic urea with thionyl chloride gives the chloride,  
a compound which when treated with a lithium reagent or a  
Grignard reagent affords the R<sup>2</sup> substituted compound (R<sup>2</sup> =  
alkyl, aryl, alkynyl, or alkenyl). Reaction of the chloride  
20 with an amine, an alkoxide, or a thioalkoxide gives the QR  
substituted compound (Q = O, S, NH). For the synthesis of  
compounds of the invention in which R<sup>8</sup> = H, it is preferred  
to open the epoxide with an amine (R<sup>8</sup> NH<sub>2</sub>) whose alkyl group  
(R<sup>8</sup>) can be removed in the final synthetic step. Several  
25 such removable alkyl groups are well known to practitioners  
of the art, preferred examples of which are allyl, p-  
methoxybenzyl (PMB) and 2,4-dimethoxybenzyl (DMB). The  
allyl group can be removed by treatment with rhodium  
chloride followed by aqueous acid. The PMB and DMB groups  
30 can be removed by catalytic hydrogenation, treatment with a  
strong acid such as trifluoroacetic acid, or by treatment  
with an oxidizing agent such as ceric ammonium nitrate, DDQ,  
or sodium persulfate.

5

## SCHEME 7

Scheme 7 describes a means of obtaining an amino-ketone useful in the previous schemes. After iodination of an appropriate aniline, the trifluoromethyl group can be introduced using a strong base and ethyl trifluoroacetate.

## SCHEME 8

15

Because certain benzo-substituents are incompatible with the methods of the previous schemes, it may be necessary to protect these groups before forming the desired product. In Scheme 8 there is shown a means of obtaining carbonyl-substituted iodo-anilines which can be modified as shown in Scheme 7. After iodination of an acetyl-aniline, the acetyl group is protected by means well known to those

5 of skill in the art, such as using 1,3-propanedithiol.  
Deprotection of the ketone can then be achieved using HgCl<sub>2</sub>  
and HgO or other means well known to those of skill in the  
art.

10

## SCHEME 9

In addition to the methods of obtaining keto-anilines  
15 described previously, nucleophilic opening of isatoic  
anhydrides can also be used as shown in Scheme 9. This  
reaction is accomplished by using an anionic nucleophile of  
the group R<sup>1a</sup>. See Mack et al, *J. Heterocyclic Chem.* **1987**,

## SCHEME 10

10        The 1,3-benzoxazepinones of this invention can be synthesized as described in Scheme 10. The starting epoxide can be ring-opened with an alkoxide (NaOR', or KOR') in which R' is a protecting group which can be removed later in the synthesis. There are many such removable groups known to practitioners of the art. These include the allyl group, as well as substituted ethyl groups such as 2-trimethylsilylethyl or 2,2,2-trichloroethyl, or substituted benzyl groups such as 3,4-dimethoxybenzyl, p-nitrobenzyl, and diphenylmethyl. The next step is to protect the

15        tertiary alcohol with a second protecting group (R'') which is stable to the conditions for the removal of the first protecting group (R'). This second protecting group can be

20

one of the allyl, substituted ethyl, or substituted benzyl groups as described above, or it can be a silyl group (such as triethylsilyl, t-butyldimethylsilyl, or t-butyldiphenylsilyl). There are many combinations of two selectively removable protecting groups which are well known to practitioners of the art. Removal of the first protecting group affords the primary alcohol which upon treatment with N,N'-carbonyldiimidazole or phosgene followed by removal of the second protecting group affords the cyclic carbamate. Treatment of the cyclic carbamate with thionyl chloride converts the tertiary alcohol to a chloride. This compound when treated with a lithium reagent or a Grignard reagent affords the R<sup>2</sup> substituted compound (R<sup>2</sup> = alkyl, aryl, alkynyl, or alkenyl). Reaction of the chloride with an amine, an alkoxide, or a thioalkoxide gives the QR substituted compound (Q = O, S, NH). Additionally, compounds of this invention in which Q = O can also be prepared by direct alkylation of the tertiary alcohol.

One enantiomer of a compound of Formula I may display superior activity compared with the other. Thus, the following stereochemistries are considered to be a part of the present invention.

30 When required, separation of the racemic material can be achieved by HPLC using a chiral column as exemplified in Examples 27-34 (Scheme 4) or by a resolution using a resolving agent such as camphonic chloride as in Thomas J. Tucker, et al, *J. Med. Chem.* **1994**, 37, 2437-2444. A chiral  
35 compound of Formula I may also be directly synthesized using a chiral catalyst or a chiral ligand, e.g. Mark A. Huffman, et al, *J. Org. Chem.* **1995**, 60, 1590-1594.

5 Other features of the invention will become apparent in the course of the following descriptions of exemplary embodiments which are given for illustration of the invention and are not intended to be limiting thereof.

10

To a solution of amino ketone **1a** (3.02 g, 13.54 mmol) in THF (55 mL) at room temperature was added potassium

5 carbonate (4.67 g, 33.85 mmol) followed by bromoacetyl  
bromide (1.5 mL, 16.93 mmol) and the resulting reaction  
mixture was allowed to stir at room temperature for 3 hours.  
The reaction mixture was poured onto water and extracted  
with ethyl acetate (3x100 mL). The combined ethyl acetate  
10 extracts were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated  
in vacuo to give a yellow oil **1b**. This product was used in  
the next step of the synthetic sequence without further  
purification.

To a solution of bromide **1b** (crude product, 13.54 mmol)  
15 in DMF (55 mL) at room temperature was added sodium  
benzenesulfinate (4.44 g, 27.08 mmol) and the resulting  
reaction mixture was allowed to stir at room temperature for  
18 hours. The reaction mixture was poured onto water and  
extracted with ethyl acetate (3x100 mL). The combined ethyl  
20 acetate extracts were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and  
concentrated in vacuo. The group is triturated with hexanes  
(1 L) and dried in vacuo to give 4.88 g an off-white solid

To a 0°C solution of cyclopropyl acetylene (48% purity, 14.6 mL, 80.9 mmol) in THF (95 mL) was syringed 1.6 M BuLi  
10 in hexane (46 mL, 73.5 mmol). After the reaction was stirred for 15-30 min. at 0°C, 1 (9.5 g, 24.5 mmol) was added as a solid and stirred for 2 h. The reaction was quenched with saturated NH<sub>4</sub>Cl. The reaction was partitioned between EtOAc and saturated NH<sub>4</sub>Cl, washed with brine, dried  
15 (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a solid. Flash chromatography (50% EtOAc/hexane) gave a white solid 2 (6.6 g, 60% yield).

A mixture of 2 (6.6g, 14.5 mmol), Al/Hg in THF (90 mL) and water (10 mL) was refluxed for 1 h. The reaction was  
20 filtered through celite, partitioned between EtOAc and water, washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a solid 3 (4 g, 90% yield). MH<sup>+</sup> = 314.0559.

A solution of 3 (4 g, 12.8 mmol), (Boc)<sub>2</sub>O (3.06 g 14 mmol) and DMAP (1.56 g, 12.8 mmol) in ACN (60 mL) was  
25 stirred for 1 h. TLC indicated that the ratio of the desired product to starting material was about 3 to 2. More (Boc)<sub>2</sub>O (0.6 g, 2.8 mmol) was added and the reaction was stirred for 10 min. TLC showed trace of starting material. The reaction was partitioned between EtOAc and 1N HCl,  
30 washed with water, saturated NaHCO<sub>3</sub> and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an orange solid 4 (4.93 g, 93% yield).

A mixture of 4 (4.63 g, 11.2 mmol), H<sub>2</sub>NOH·HCl (3.11 g, 44.8 mmol) and DIEA (7.8 mL, 44.8 mmol) in EtOH (65 mL) was  
35 stirred for 2 h. The reaction was diluted with EtOAc, washed with dilute HCl (6X), water, saturated NaHCO<sub>3</sub>, brine and dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a thick orange oil 5 (5.3 g, 95% yield).

5 A solution of 5 (4.94 g, 11 mmol), TsCl (5.32 g, 27.9 mmol) and 1N NaOH (53.2 mL, 53.2 mmol) in dioxane (240 mL) was stirred for 1.5 h. The reaction was partitioned between EtOAc and saturated NaHCO<sub>3</sub>, washed with brine, and evaporated to give a semi-solid. A solution of the semi-  
10 solid in TFA (20 mL) and CH<sub>2</sub>Cl<sub>2</sub> (200 mL) was stirred for 2 h and evaporated to give a thick oil. The oil was partitioned between EtOAc and saturated NaHCO<sub>3</sub> and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a thick dark orange oil. Crystallized from dichloroethane to give a white crystalline  
15 solid 6 (1.25 g, 40% yield, mp 240-242°C).

To a solution of **9** (8.48 g, 18.2 mmol) and nitromethane (1.97 mL, 36.4 mmol) in DME (85 mL) was added 60% NaH (2.55 g, 63.8 mmol). After stirring for 1.5 h, TLC indicated that the ratio of the alcohol intermediate **10** to starting

15 material was about 2 to 3. TBS-Cl (13.7 g, 91 mmol) was added and the reaction was stirred for 0.5 h. TLC indicated that the ratio of the desired product **11** to **10** was about 4 to 1. The reaction was stirred for another 2 h. The reaction was diluted with EtOAc and partitioned between

20 EtOAc and saturated NaHCO<sub>3</sub>. The reaction was filtered and

5 the organic phase was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an orange oil (22.3 g). The oil was triturated with hexane and washed with same solvent two times to provide a yellow solid **11** (8.2 g, 75% yield).

A mixture of **11** (8.2 g, 13.8 mmol) and K<sub>2</sub>CO<sub>3</sub> (2.2 g) in  
10 toluene (80 mL) was refluxed for 0.5 h. The reaction was diluted with EtOAc and washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an dark orange oil (7.4 g). The oil was triturated with hot hexane and washed with same solvent two times to provide a brown solid **12** (5 g, 71.5%  
15 yield).

To a -78°C solution of **12** (204 mg, 0.4 mmol) in THF (2 mL) was added 2M BuMgCl in ether (0.6 mL, 1.2 mmol), TLC showed no starting material. The reaction was quenched with saturated NH<sub>4</sub>Cl and partitioned between EtOAc and saturated  
20 NH<sub>4</sub>Cl, washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an orange oil (240 mg). Flash chromatography (3% EtOAc/hexane) gave a pale yellow glass **13** (94 mg).

A mixture **13** (75 mg), a slurry of Raney nickel (2 mL) and hydrazine monohydrate (0.1 mL) in ethnol (4 mL) was  
25 stirred for 2 h. The reaction was filtered with celite and partitioned between EtOAc and water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an orange oil (85 mg). Flash chromatography (20% EtOAc/hexane) gave a pale yellow glass (46 mg). A solution of the glass (46 mg) in MeOH (1  
30 mL) and concentrated HCl (0.1 mL) was stirred for 15 min. and filtered off. The filtrate was partitioned between EtOAc and 1N NaOH and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an orange oil (20 mg). A solution of the oil (20 mg) and carbonyl diimidazole (33 mg) in THF (1 mL) was  
35 stirred overnight. The solvent was evaporated to give an oil which was triturated with Et<sub>2</sub>O/hexane/CH<sub>2</sub>Cl<sub>2</sub> to provide a fine powder **14** (5.6 mg, mp 174-176°C).

5 An alternative means of converting **12** to **13** is as follows. To a  $-78^{\circ}\text{C}$  solution of **12** (100 mg, 0.2 mmol) in toluene (2 mL) was added 1M (i-Bu)<sub>3</sub>Al in toluene (0.4 mL, 0.4 mmol), TLC showed no starting material. The reaction was quenched with 0.1M HCl and partitioned between EtOAc and  
10 0.1M HCl, washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give an orange oil **13** (121 mg).

### Example 6

Preparation of 7-chloro-5-(2-cyclopropylethynyl)-1,5-dihydro-3-methyl-5-(trifluoromethyl)-1,3-benzodiazepin-2-one  
15

A solution of approximately 15 mmoles of diazomethane  
20 in 40 mL of ether was generated from 5 g of Diazald® following the directions provided by the vender (Aldrich Chemical Company). This solution was added to a solution of

5     **201** (2.6 g, 11.6 mmol) in 10 mL of ether and the reaction mixture was stirred for 3 hr at room temperature at which time tlc showed complete conversion to epoxide **202**. Excess diazomethane was quenched by the addition of acetic acid, 10 mL of ethanol was added, and the solution was concentrated to a volume of approximately 10 mL on a rotary evaporator. To this solution was added 20 mL of a solution of 33% methylamine in ethanol and the mixture was stirred at room temperature overnight. Evaporation of the solvent under reduced pressure afforded **203** (3.4 g) a semisolid product which was used without purification in the next reaction.

          To a solution of **203** (2.9 g, 10.8 mmol) in 50 mL of dry THF was added N,N'-carbonyldiimidazole (2.6 g, 16.2 mmol) and the reaction mixture was stirred for 1.75 h at ambient temperature. An additional 500 mg of N,N'-carbonyldiimidazole was added and the reaction was allowed to proceed for an additional 30 min. Sodium methoxide in methanol (10 mL of a 3.24M solution) was added and the mixture was refluxed for 30 min. The cooled mixture was poured onto aqueous ammonium chloride, and this mixture was extracted twice with ethyl acetate. The combined extracts were dried over sodium sulfate and evaporated to an orange oil. Flash chromatography (50-70% EtOAc/hexane) gave after washing with methylene chloride a white solid **204** (1.5 g, 42.5% yield).

30       To a solution of **204** (1.17g, 3.97 mmol) in 50 mL of dry THF was added triethylamine (2.3 mL, 16.67 mmol) and thionyl chloride (1.2 mL, 15.88 mmol). After stirring 15 min at ambient temperature, 25 mL of methanol was added and this mixture was stirred for 15 min before being poured onto aqueous sodium bicarbonate. The mixture was extracted with ether and the extract was dried over magnesium sulfate and concentrated to a yellow solid **205** (1.18 g, 95% yield) which was used without purification.

          To a 0°C solution of cyclopropylacetylene (35% purity, 0.45 mL) in THF (3 mL) was syringed 1.6 M BuLi in hexane

5 (0.625 mL, 1.0 mmol). After the reaction was stirred for 30 min. at 0°C, the reaction mixture was cooled to -50°C, 205 (85 mg, 0.27 mmol) in THF (0.7 mL) was added and the reaction mixture was allowed to warm to room temperature over 2 h. The reaction was poured onto saturated ammonium  
10 chloride and was extracted with ether. The extracts were washed with brine, dried over magnesium sulfate and evaporated to give an oil. Flash chromatography (50% EtOAc/hexane) gave after crystallization from ethyl acetate/hexane colorless crystals of the title compound (27  
15 mg, mp 177-178°C).

10

To a solution of allyl alcohol (243 mL, 3.57 mmol) in 5 mL of dry THF at room temperature was added sodium hydride (82 mg, 3.41 mmol). After 30 min, **205** (160 mg, 0.51 mmol) in THF (3 mL) was added and the reaction mixture was stirred at ambient temperature for 35 min. The reaction was poured onto saturated ammonium chloride and was extracted with ethyl acetate. The extracts were washed with brine, dried over magnesium sulfate and evaporated to give an oil. Flash chromatography (40-60% EtOAc/hexane) gave 99 mg of a solid which was recrystallized from ethyl acetate/hexane to afford colorless crystals of the title compound (mp 163-165°C).

## Example 15

**Preparation of 7-chloro-5-(cyclopropylmethoxy)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

10

To a solid mixture of 95% sodium hydride (650 mg, 25.7 mmol) and trimethylsulfoxonium iodide (6.0 g, 27 mmol) was added dropwise with stirring over 15 min, 35 mL of dry DMSO. After an additional 20 min of stirring at ambient

5 temperature, hydrogen evolution had ceased, and a solution  
of **201** (3.35 g, 15 mmol) in dry THF (65 mL) was run in over  
3 min. After an additional 2 min, the reaction was quenched  
with water. The reaction mixture was poured onto water and  
10 extracted with ether. The ether layer was washed twice with  
brine and was dried over magnesium sulfate. Ethanol (15 mL)  
was added to this ethereal solution and this was  
concentrated at 20° under reduced pressure to a volume of 15  
mL. Allylamine (4.6 g, 81 mmol) was added and the solution  
was stirred overnight at ambient temperature after which  
15 time it was concentrated at 40° to **206** as an oily product.

To a solution of **206** in 65 mL of dry THF was added  
N,N'-carbonyldiimidazole (2.5 g, 15 mmol) and triethylamine  
(6.3 mL, 45 mmol) and the reaction mixture was stirred  
overnight at ambient temperature. Ethanol (25 mL) was added  
20 and the mixture was refluxed for 2 h and then evaporated to  
a small volume. This was taken up in ethyl acetate, and  
this solution was washed with water, aqueous citric acid,  
and brine, dried over sodium sulfate and concentrated to an  
oil. Addition of methylene chloride precipitated the  
25 product and **207** was collected as colorless crystals (3.05 g,  
63%).

To a solution of **207** (4.6 g, 14.38 mmol) and pyridine  
(1.393 mL, 17.25 mmol) in 55 mL of dry THF at 0° was added  
dropwise thionyl chloride (1.865 g, 15.8 mmol). After  
30 addition was complete, the cooling bath was removed, and  
stirring was continued at ambient temperature for 1 h. The  
reaction mixture was partitioned between water and ethyl  
acetate, and the organic layer was washed with brine, dried  
and evaporated to **208** as a crystalline product (4.4 g).

35 To a solution of cyclopropylmethanol (9 mL) in 45 mL of  
dry DMSO was added 100% sodium hydride (1.8 g). This was  
stirred for 3 h at ambient temperature until hydrogen  
evolution ceased after which time **208** (4.4 g, 13 mmol) was  
added in one portion. After stirring at ambient temperature  
40 for 1 h, the reaction mixture was partitioned between ethyl

5 acetate and aqueous citric acid, and the organic layer was washed with brine, dried (sodium sulfate) and evaporated to an oily product. Flash chromatography (25% EtOAc/hexane) gave after crystallization from hexane **209** (3.0 g).

A solution of **209** (1.2 g) and rhodium trichloride hydrate (60 mg) in ethanol (100 mL) was refluxed for 2 h. The mixture was cooled to 60°, 1N hydrochloric acid (20 mL) was added, and the mixture was stirred at 60° for 2 h. The cooled mixture was partitioned between water and ethyl acetate, and the organic layer was washed with aqueous sodium bicarbonate and brine, dried and evaporated to a solid. Flash chromatography (50-75% ether/hexane) followed by crystallization from methylene chloride-hexane afforded the title compound (840 mg, 78%, mp 185-186°C) as colorless crystals.

10

To a solid mixture of 95% sodium hydride (1.94 g, 81 mmol) and trimethylsulfoxonium iodide (17.8 g, 81 mmol) was added dropwise with stirring over 20 min, 100 mL of dry DMSO. After an additional 20 min of stirring at ambient temperature, hydrogen evolution had ceased, and a solution of **201** (10 g, 44.7 mmol) in dry THF (200 mL) was run in over 5 min. After an additional 2 min, the reaction was quenched with water. The reaction mixture was poured onto water and extracted with ether. The ether layer was washed twice with

20

5 brine and was dried over magnesium sulfate. Ethanol (35 mL) was added to this ethereal solution and this was concentrated at 20° under reduced pressure to a volume of 35 mL. Cyclopropylamine (12.4 mL, 179 mmol) was added and the solution was stirred overnight at ambient temperature and  
10 then 2 h at 50° after which time it was concentrated at 40° to **210** (9.4 g) as an oily product.

To a solution of **210** (9.4 g, 31.9 mmol) in 250 mL of dry THF was added N,N'-carbonyldiimidazole (9.3 g, 57.4 mmol) and the reaction mixture was stirred overnight at  
15 ambient temperature and evaporated to a solid. Ethanol (150 mL), and triethylamine (13 mL) was added and the mixture was refluxed for 4 h and then evaporated to a small volume. This was taken up in ethyl acetate, and this solution was washed with water, aqueous citric acid, and brine, dried  
20 over sodium sulfate and concentrated to an oil. Crystallization from ethyl acetate hexane afforded 2.6 g of a crystalline product. Flash chromatography of the mother liquor on silica gel (40-50% ethyl acetate-hexane) afforded an additional 1.7 g for a total of 4.3 g (42%) of **211** as  
25 colorless crystals.

To a solution of **211** (4.3 g, 13.4 mmol) and pyridine (1.6 mL, 20.1 mmol) in 48 mL of dry THF at 0° was added dropwise thionyl chloride (2.0 mL). After addition was complete, the cooling bath was removed, and stirring was  
30 continued at ambient temperature for 20 min. The reaction mixture was partitioned between water and ethyl acetate, and the organic layer was washed with brine, dried and evaporated to **212** as a crystalline product (4.2 g).

To a solution of cyclopropylmethanol (9 mL) in 75 mL of  
35 dry DMSO was added 100% sodium hydride (840 mg). This was stirred for 1 h at ambient temperature until hydrogen evolution ceased after which time **212** (4.0 g, 11.8 mmol) in DMSO (25 mL) was added. After stirring at ambient temperature for 1 h, the reaction mixture was partitioned  
40 between ethyl ether and aqueous citric acid, and the organic

5 layer was washed with brine, dried (sodium sulfate) and evaporated to an oily product. Flash chromatography on silica gel (10-60% EtOAc-hexane) gave after crystallization from ethyl acetate -hexane the title compound (2.15 g, 49%, mp 153.5-155°C) as colorless crystals.

10

A solution of approximately 28 mmoles of diazomethane in 100 mL of ether was generated from 10 g of Diazald® following the directions provided by the vender (Aldrich Chemical Company). This solution was added to a solution of **201** (5.2 g, 23.2 mmoles) in 20 mL of ether and the reaction mixture was stirred for 3 hr at room temperature at which time tlc showed complete conversion to epoxide **202**. Excess diazomethane was quenched by the addition of acetic acid, 20 mL of ethanol was added, and the solution was concentrated to a volume of approximately 20 mL on a rotary evaporator. To this solution was added 20 mL of a solution of 2M

5 ethylamine in THF and the mixture was stirred in a stoppered flask at 50° for 5 h. Evaporation of the solvent under reduced pressure afforded after purification by flash chromatography on silica gel (20% ethylacetate-hexane) 213 (2.7 g) as an oil.

10 To a solution of 213 (2.7 g) in 45 mL of dry THF was added N,N'-carbonyldiimidazole (1.8 g), and triethylamine (4.2 mL) and the reaction mixture was stirred overnight at ambient temperature. Ethanol (15 mL) was added and the mixture was refluxed for 3 h, then evaporated to a small  
15 volume. This was taken up in ethyl acetate, and this solution was washed with water, aqueous citric acid, and brine, dried over sodium sulfate and concentrated to an oil. Addition of methylene chloride precipitated the product and 214 was collected as colorless crystals (1.73 g).

20 To a solution of 214 (1.54 g) and pyridine (0.50 mL) in 20 mL of dry THF at 0° was added dropwise thionyl chloride (0.400 mL) After addition was complete, the cooling bath was removed, and stirring was continued at ambient temperature for 1 h. The reaction mixture was partitioned between water  
25 and ethyl acetate, and the organic layer which contained both dissolved and undissolved product was evaporated to 215 as a crystalline product (1.43 g).

To a solution of cyclopropylmethanol (0.20 mL) in 3 mL of dry DMSO was added 100% sodium hydride (36 mg). This was  
30 stirred for 30 min at ambient temperature until hydrogen evolution ceased after which time 215 (150 mg) was added in one portion. After stirring at ambient temperature for 20 min, the reaction mixture was partitioned between ethyl acetate and aqueous citric acid, and the organic layer was  
35 washed with brine, dried (sodium sulfate) and evaporated to a solid product. This was recrystallized from ethyl acetate-hexane to afford the title compound (85 mg, mp 157-159°) as colorless crystals.

10

To a 0° solution of N-pivaloyl-4-fluoroaniline (10 g) in 150 mL of dry THF was added dropwise over 20 min 1.6M butyllithium in hexane (77 mL). After stirring at 0° for 1 h, ethyltrifluoroacetate (14.0 mL) was added and the reaction mixture was allowed to warm to room temperature over 1.5 h. The reaction was quenched by the addition of aqueous ammonium chloride and the mixture was partitioned between water and ether. The ether layer was dried and concentrated to a brown oil (18.3 g) which was used directly in the next reaction.

15

This oil was dissolved in 15 mL of ethylene glycol dimethyl ether, 75 mL of concentrated aqueous hydrochloric acid was added and the mixture was refluxed for 1.5 h. The

20

5 cooled reaction mixture was diluted with water and made basic with solid sodium carbonate. This was extracted with ether, and the extracts were dried and evaporated to an oil which was purified by flash chromatography on silica gel (10-20% ethyl acetate-hexane) to afford after  
10 recrystallization from ethyl acetate-hexane, 2.65 g of 2-amino-5-fluoro-1',1',1'-trifluoroacetophenone **216**.

A solution of approximately 15 mmoles of diazomethane in 40 mL of ether was generated from 5 g of Diazald® following the directions provided by the vendor (Aldrich  
15 Chemical Company). This solution was added to a solution of 2-amino-5-fluoro-1',1',1'-trifluoroacetophenone **216** (2.65 g, 12.8 mmoles) in 10 mL of ether and the reaction mixture was stirred for 5 hr at room temperature at which time tlc showed complete conversion to epoxide **217**. Excess  
20 diazomethane was quenched by the addition of acetic acid. To one-half of this solution (containing approximately 6.5 mmol of epoxide) 10 mL of ethanol was added, and the solution was concentrated to a volume of approximately 10 mL on a rotary evaporator. To this solution was added 1.69 mL  
25 of allylamine and the mixture was stirred at room temperature overnight. Evaporation of the solvent under reduced pressure afforded a crude product which was purified by flash chromatography on silica gel (10-50% ethyl acetate-hexane) affording 1.05 g of the product **218** as an oil.

30 To a solution of **218** (1.05 g, 3.77 mmol) in 20 mL of dry THF was added N,N'-carbonyldiimidazole (856 mg) and triethylamine (2.6 mL) and the reaction mixture was stirred overnight at ambient temperature. Ethanol (7 mL) was added and the mixture was refluxed for 6 h. The cooled mixture  
35 was poured onto water, and this mixture was extracted twice with ethyl acetate. The combined extracts were dried over sodium sulfate and evaporated. Flash chromatography (20-50% EtOAc/hexane) gave **219** as a white solid (858 mg, 75%).

To a solution of **219** (850 mg) and pyridine (0.339 mL)  
40 in 12 mL of dry THF at 0° was added dropwise thionyl

5 chloride (0.407 mL) After addition was complete, the cooling  
bath was removed, and stirring was continued at ambient  
temperature for 30 min. The reaction mixture was  
partitioned between water and ethyl acetate, and the organic  
layer which contained both dissolved and undissolved product  
10 was evaporated to **220** as a crystalline product (785 mg,  
87%).

To a solution of cyclopropylmethanol (0.624 mL) in 5 mL  
of dry DMSO was added 100% sodium hydride (55 mg). This was  
stirred for 30 min at ambient temperature until hydrogen  
15 evolution ceased after which time **220** (250 mg) in DMSO (3.5  
mL) was added in one portion. After stirring at ambient  
temperature for 2 h, the reaction mixture was partitioned  
between ether and aqueous citric acid, and the organic layer  
was washed with brine, dried (sodium sulfate) and evaporated  
20 to **221** (240 mg) as a solid.

A solution of **221** (135 mg) and rhodium trichloride  
hydrate (8 mg) in ethanol (10 mL) was refluxed for 1.5 h.  
The mixture was cooled to 60°, 1N hydrochloric acid (2.5 mL)  
was added, and the mixture was stirred at 60° for 1 h. The  
25 cooled mixture was partitioned between water and ethyl  
acetate, and the organic layer was washed with aqueous  
sodium bicarbonate and brine, dried and evaporated to an  
oil. Crystallization from ethyl acetate-hexane afforded the  
title compound (55 mg, mp 198-199°C) as a colorless solid.

20 solution was washed with 1% aqueous acetic acid, and brine, dried and evaporated to **222** (13.2 g, 65%).

To a solution of **222** (13.0 g) in 150 mL of dry THF was added N,N'-carbonyldiimidazole (6.5 g), and triethylamine (13 mL) and the reaction mixture was stirred 4 h at ambient  
25 temperature. Ethanol (75 mL) was added and the mixture was refluxed overnight, then evaporated to a small volume. This was diluted with water and extracted twice with ethyl acetate. The combined extracts were dried and evaporated to a solid which upon trituration with methylene chloride  
30 afforded **223** as colorless crystals (10.1 g, 73%).

To a solution of **223** (2.92 g, 6.75 mmol) and pyridine (0.685 mL, 1.2 equiv) in 30 mL of dry THF at 0° was added dropwise thionyl chloride (0.540 mL, 1.1 equiv). After addition was complete, the cooling bath was removed, and  
35 stirring was continued at ambient temperature for 1 h. The reaction mixture was partitioned between water and ethyl acetate, and the organic layer which contained both dissolved and undissolved product was evaporated to **224** as a crystalline product (2.4 g, 79%).

5 To a solution of (1-methylcyclopropyl)acetylene (144 mg, 1.8 mmol) in dry THF (4 mL) at 0° was added 1.6 M butyllithium in hexane (0.99 mL, 1.58 mmol). After 30 min at 0°, the mixture was cooled to -30° and **224** (200 mg, 0.45 mmol) in THF (2 mL) was added dropwise. The reaction  
10 mixture was allowed to warm to 0° over 30 min after which time it was poured onto aqueous citric acid and extracted twice with ether. The combined extracts were washed with brine, dried and evaporated to 260 mg of **225** as a solid which was used directly in the next reaction.

15 A solution of **225** (250 mg) in trifluoroacetic acid (1.5 mL) was stirred at room temperature for 30 min then poured onto aqueous sodium bicarbonate and extracted with ethyl acetate. The combined extracts were washed with brine, dried and evaporated to an impure solid which was purified  
20 by flash chromatography on silica gel (20-80% ethyl acetate-hexane) followed by recrystallization from ether-ethyl acetate-hexane to afford the title compound (6 mg, mp 196-198°) as colorless crystals.

**Example 42**

**Preparation of 7-chloro-5-cyclobutylmethoxy-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

30

To a solution of cyclobutylmethanol (0.456 mL) in 7 mL of dry THF at room temperature was added sodium hydride (110 mg). After 30 min, chloride **224** (300 mg) in THF (3.5 mL) was added and the reaction mixture was stirred at ambient  
35 temperature for 1 h. The reaction was poured onto saturated

5 ammonium chloride and was extracted with ethyl acetate. The extracts dried over magnesium sulfate and evaporated to give a crude product which was purified by flash chromatography (20-40% EtOAc/hexane) gave 124 mg solid product.

A solution of this material in 2.5 mL of  
10 trifluoroacetic acid was stirred at room temperature for 30 min and then partitioned between ethyl acetate and aqueous sodium bicarbonate. The organic phase was dried and evaporated to a crude product which was purified by flash chromatography on silica gel (50% ethyl acetate-hexane) to  
15 afford the title compound (74 mg, mp 201.6-202.9°C) as colorless crystals.

#### Example 43

20 Preparation of 7-chloro-5-(3-methyl-2-butenyloxy)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one

The title compound ( $^{19}\text{F}$  NMR:  $\delta$  -75.638 ppm) is prepared  
25 according to the method of Example 42 by substituting 3-methyl-2-buten-1-ol for cyclobutylmethanol.

5

**Example 44**

**Preparation of 7-chloro-5-(phenylmethoxy)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

10

The title compound (mp 177-178°C) is prepared according to the method of Example 42 by substituting benzyl alcohol for cyclobutylmethanol.

15

**Example 45**

**Preparation of 7-chloro-5-[(2-pyridyl)methoxy]-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

20

The title compound (mp 233-235°C) is prepared according to the method of Example 42 by substituting pyridine-2-methanol for cyclobutylmethanol.

5

**Example 46**

**Preparation of 7-chloro-5-[(1-methylcyclopropyl)methoxy]-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

10

The title compound (mp 211-212°C) is prepared according to the method of Example 42 by substituting (1-methylcyclopropyl)methanol for cyclobutylmethanol.

15

**Example 47**

**Preparation of 7-chloro-5-(3-methylphenyloxy)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

20

To a solution of m-cresol (0.259 mL) in 5 mL of dry THF at room temperature was added sodium hydride (41 mg). After 10 min, chloride **224** (300 mg) in THF (3.5 mL) was added and the reaction mixture was stirred at ambient temperature for 1 h. The reaction was poured onto saturated ammonium chloride and was extracted with ethyl acetate. The extracts dried over magnesium sulfate and evaporated to give a white solid.

25

5 A solution of this material in 3 mL of trifluoroacetic acid was stirred at room temperature for 2 h and then partitioned between ethyl acetate and aqueous sodium bicarbonate. The organic phase was dried and evaporated to a crude product which was purified by flash chromatography  
10 on silica gel (35-50% ethyl acetate-hexane). Crystallization from chloroform and recrystallization from 10% ethyl acetate hexane afforded the title compound (25 mg, mp 137.1-140°C) as colorless crystals.

15

**Example 48**

**Preparation of 7-chloro-5-(cyclopropylmethylthio)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

20

To a solution of cyclopropylmethyl mercaptan (532 mg) in 2.3 mL of dry THF at room temperature was added sodium hydride (41 mg). After 10 min, chloride **224** (200 mg) was added and the reaction mixture was stirred at ambient  
25 temperature for 1.5 h. The reaction was poured onto saturated ammonium chloride and was extracted with ethyl acetate. The extracts dried over magnesium sulfate and evaporated to give a white solid.

A solution of this material in 3 mL of trifluoroacetic acid was stirred at room temperature for 2 h and then partitioned between ethyl acetate and aqueous sodium bicarbonate. The organic phase was dried and evaporated to a solid product which was twice from methylene chloride-hexane to afford the title compound (mp 175-177°C) as a  
35 colorless solid.

5

**Example 49**

**Preparation of 7-chloro-5-(propylthio)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

10

The title compound (mp 156-157°C) is prepared according to the method of Example 48 by substituting propanethiol for cyclopropylmethyl mercaptan.

15

**Example 50**

**Preparation of 7-chloro-5-(2-propenylthio)-1,5-dihydro-5-(trifluoromethyl)-1,3-benzodiazepin-2-one**

20

The title compound (mp 147.3-149°C) is prepared according to the method of Example 48 by substituting allyl mercaptan for cyclopropylmethyl mercaptan.

Utility

The compounds of this invention possess reverse transcriptase inhibitory activity, in particular, HIV inhibitory efficacy. The compounds of formula (I) possess HIV reverse transcriptase inhibitory activity and are therefore useful as antiviral agents for the treatment of HIV infection and associated diseases. The compounds of formula (I) possess HIV reverse transcriptase inhibitory activity and are effective as inhibitors of HIV growth. The ability of the compounds of the present invention to inhibit viral growth or infectivity is demonstrated in standard assay of viral growth or infectivity, for example, using the assay described below.

The compounds of formula (I) of the present invention are also useful for the inhibition of HIV in an *ex vivo* sample containing HIV or expected to be exposed to HIV. Thus, the compounds of the present invention may be used to inhibit HIV present in a body fluid sample (for example, a serum or semen sample) which contains or is suspected to contain or be exposed to HIV.

The compounds provided by this invention are also useful as standard or reference compounds for use in tests or assays for determining the ability of an agent to inhibit viral clone replication and/or HIV reverse transcriptase, for example in a pharmaceutical research program. Thus, the compounds of the present invention may be used as a control or reference compound in such assays and as a quality control standard. The compounds of the present invention may be provided in a commercial kit or container for use as such standard or reference compound.

Since the compounds of the present invention exhibit specificity for HIV reverse transcriptase, the compounds of the present invention may also be useful as diagnostic reagents in diagnostic assays for the detection of HIV reverse transcriptase. Thus, inhibition of the reverse transcriptase activity in an assay (such as the assays

5 described herein) by a compound of the present invention would be indicative of the presence of HIV reverse transcriptase and HIV virus.

As used herein "µg" denotes microgram, "mg" denotes milligram, "g" denotes gram, "µL" denotes microliter, "mL" denotes milliliter, "L" denotes liter, "nM" denotes nanomolar, "µM" denotes micromolar, "mM" denotes millimolar, "M" denotes molar and "nm" denotes nanometer. "Sigma" stands for the Sigma-Aldrich Corp. of St. Louis, MO.

15 HIV RNA Assay

DNA Plasmids and in vitro RNA transcripts:

Plasmid pDAB 72 containing both gag and pol sequences of BH10 (bp 113-1816) cloned into PTZ 19R was prepared according to Erickson-Viitanen et al. *AIDS Research and Human Retroviruses* **1989**, 5, 577. The plasmid was linearized with Bam HI prior to the generation of in vitro RNA transcripts using the Riboprobe Gemini system II kit (Promega) with T7 RNA polymerase. Synthesized RNA was purified by treatment with RNase free DNase (Promega), phenol-chloroform extraction, and ethanol precipitation. RNA transcripts were dissolved in water, and stored at -70°C. The concentration of RNA was determined from the A<sub>260</sub>.

30 Probes:

Biotinylated capture probes were purified by HPLC after synthesis on an Applied Biosystems (Foster City, CA) DNA synthesizer by addition of biotin to the 5' terminal end of the oligonucleotide, using the biotin-phosphoramidite reagent of Cocuzza, *Tet. Lett.* **1989**, 30, 6287. The gag biotinylated capture probe (5-biotin-CTAGCTCCCTGCTTGCCCATACTA 3') was complementary to nucleotides 889-912 of HXB2 and the pol biotinylated capture probe (5'-biotin -CCCTATCATTTTTGGTTTCCAT 3' ) was complementary to nucleotides 2374-2395 of HXB2. Alkaline

5 phosphatase conjugated oligonucleotides used as reporter  
probes were prepared by Syngene (San Diego, CA.). The pol  
reporter probe (5' CTGTCTTACTTTGATAAAACCTC 3') was  
complementary to nucleotides 2403-2425 of HXB2. The gag  
reporter probe (5' CCCAGTATTTGTCTACAGCCTTCT 3') was  
10 complementary to nucleotides 950-973 of HXB2. All  
nucleotide positions are those of the GenBank Genetic  
Sequence Data Bank as accessed through the Genetics Computer  
Group Sequence Analysis Software Package (Devereau *Nucleic  
Acids Research* 1984, 12, 387). The reporter probes were  
15 prepared as 0.5  $\mu$ M stocks in 2 x SSC (0.3 M NaCl, 0.03 M  
sodium citrate), 0.05 M Tris pH 8.8, 1 mg/mL BSA. The  
biotinylated capture probes were prepared as 100  $\mu$ M stocks  
in water.

20 Streptavidin coated plates:

Streptavidin coated plates were obtained from Du Pont  
Biotechnology Systems (Boston, MA).

Cells and virus stocks:

25 MT-2 and MT-4 cells were maintained in RPMI 1640  
supplemented with 5% fetal calf serum (FCS) for MT-2 cells  
or 10% FCS for MT-4 cells, 2 mM L-glutamine and 50  $\mu$ g/mL  
gentamycin, all from Gibco. HIV-1 RF was propagated in MT-4  
cells in the same medium. Virus stocks were prepared  
30 approximately 10 days after acute infection of MT-4 cells  
and stored as aliquots at -70°C. Infectious titers of HIV-  
1(RF) stocks were 1-3 x 10<sup>7</sup> PFU (plaque forming units)/mL as  
measured by plaque assay on MT-2 cells (see below). Each  
aliquot of virus stock used for infection was thawed only  
35 once.

For evaluation of antiviral efficacy, cells to be  
infected were subcultured one day prior to infection. On  
the day of infection, cells were resuspended at 5 x 10<sup>5</sup>  
cells/mL in RPMI 1640, 5% FCS for bulk infections or at 2 x

- 5  $10^6$ /mL in Dulbecco's modified Eagles medium with 5% FCS for infection in microtiter plates. Virus was added and culture continued for 3 days at 37°C.

HIV RNA assay:

- 10 Cell lysates or purified RNA in 3 M or 5 M GED were mixed with 5 M GED and capture probe to a final guanidinium isothiocyanate concentration of 3 M and a final biotin oligonucleotide concentration of 30 nM. Hybridization was carried out in sealed U bottom 96 well tissue culture plates
- 15 (Nunc or Costar) for 16-20 hours at 37°C. RNA hybridization reactions were diluted three-fold with deionized water to a final guanidinium isothiocyanate concentration of 1 M and aliquots (150  $\mu$ L) were transferred to streptavidin coated microtiter plates wells. Binding of capture probe and
- 20 capture probe-RNA hybrid to the immobilized streptavidin was allowed to proceed for 2 hours at room temperature, after which the plates were washed 6 times with DuPont ELISA plate wash buffer (phosphate buffered saline(PBS), 0.05% Tween 20.) A second hybridization of reporter probe to the
- 25 immobilized complex of capture probe and hybridized target RNA was carried out in the washed streptavidin coated well by addition of 120  $\mu$ L of a hybridization cocktail containing 4 X SSC, 0.66% Triton X 100, 6.66% deionized formamide, 1 mg/mL BSA and 5 nM reporter probe. After hybridization for
- 30 one hour at 37°C, the plate was again washed 6 times. Immobilized alkaline phosphatase activity was detected by addition of 100  $\mu$ L of 0.2 mM 4-methylumbelliferyl phosphate (MUBP, JBL Scientific) in buffer  $\delta$  (2.5 M diethanolamine pH 8.9 (JBL Scientific), 10 mM  $MgCl_2$ , 5 mM zinc acetate
- 35 dihydrate and 5 mM N-hydroxyethyl-ethylene-diamine-triacetic acid). The plates were incubated at 37°C. Fluorescence at 450 nm was measured using a microplate fluorometer (Dynateck) exciting at 365 nm.

5 Microplate based compound evaluation in HIV-1 infected MT-2  
cells:

Compounds to be evaluated were dissolved in DMSO and diluted in culture medium to twice the highest concentration to be tested and a maximum DMSO concentration of 2%.

- 10 Further three-fold serial dilutions of the compound in culture medium were performed directly in U bottom microtiter plates (Nunc). After compound dilution, MT-2 cells (50  $\mu$ L) were added to a final concentration of  $5 \times 10^5$  per mL ( $1 \times 10^5$  per well). Cells were incubated with  
15 compounds for 30 minutes at 37°C in a CO<sub>2</sub> incubator. For evaluation of antiviral potency, an appropriate dilution of HIV-1 (RF) virus stock (50  $\mu$ L) was added to culture wells containing cells and dilutions of the test compounds. The final volume in each well was 200  $\mu$ L. Eight wells per plate  
20 were left uninfected with 50  $\mu$ L of medium added in place of virus, while eight wells were infected in the absence of any antiviral compound. For evaluation of compound toxicity, parallel plates were cultured without virus infection.

- After 3 days of culture at 37°C in a humidified chamber  
25 inside a CO<sub>2</sub> incubator, all but 25  $\mu$ L of medium/well was removed from the HIV infected plates. Thirty seven  $\mu$ L of 5 M GED containing biotinylated capture probe was added to the settled cells and remaining medium in each well to a final concentration of 3 M GED and 30 nM capture probe.

- 30 Hybridization of the capture probe to HIV RNA in the cell lysate was carried out in the same microplate well used for virus culture by sealing the plate with a plate sealer (Costar), and incubating for 16-20 hrs in a 37°C incubator. Distilled water was then added to each well to dilute the  
35 hybridization reaction three-fold and 150  $\mu$ L of this diluted mixture was transferred to a streptavidin coated microtiter plate. HIV RNA was quantitated as described above. A standard curve, prepared by adding known amounts of pDAB 72 *in vitro* RNA transcript to wells containing lysed uninfected

5 cells, was run on each microtiter plate in order to determine the amount of viral RNA made during the infection.

In order to standardize the virus inoculum used in the evaluation of compounds for antiviral activity, dilutions of virus were selected which resulted in an IC<sub>90</sub> value

10 (concentration of compound required to reduce the HIV RNA level by 90%) for dideoxycytidine (ddC) of 0.2 µg/mL. IC<sub>90</sub> values of other antiviral compounds, both more and less potent than ddC, were reproducible using several stocks of HIV-1 (RF) when this procedure was followed. This  
15 concentration of virus corresponded to  $\sim 3 \times 10^5$  PFU (measured by plaque assay on MT-2 cells) per assay well and typically produced approximately 75% of the maximum viral RNA level achievable at any virus inoculum. For the HIV RNA assay, IC<sub>90</sub> values were determined from the percent  
20 reduction of net signal (signal from infected cell samples minus signal from uninfected cell samples) in the RNA assay relative to the net signal from infected, untreated cells on the same culture plate (average of eight wells). Valid performance of individual infection and RNA assay tests was  
25 judged according to three criteria. It was required that the virus infection should result in an RNA assay signal equal to or greater than the signal generated from 2 ng of pDAB 72 *in vitro* RNA transcript. The IC<sub>90</sub> for ddC, determined in each assay run, should be between 0.1 and 0.3  
30 µg/mL. Finally, the plateau level of viral RNA produced by an effective reverse transcriptase inhibitor should be less than 10% of the level achieved in an uninhibited infection.

For antiviral potency tests, all manipulations in microtiter plates, following the initial addition of 2X  
35 concentrated compound solution to a single row of wells, were performed using a Perkin Elmer/Cetus ProPette.

Compounds tested in the above assay are considered to be active if they exhibit an IC<sub>90</sub> of  $\leq 20$  µM. Preferred compounds of the present invention have IC<sub>90</sub>'s of  $\leq 5$  µM.

5 More preferred compounds of the present invention have IC<sub>90</sub>'s of  $\leq 0.5$   $\mu$ M. Even more preferred compounds of the present invention have IC<sub>90</sub>'s of  $\leq 0.05$   $\mu$ M. Still more preferred compounds of the present invention have IC<sub>90</sub>'s of  $\leq 0.005$   $\mu$ M.

10 Using the methodology described above, a number of compounds of the present invention were found to exhibit an IC<sub>90</sub> of  $\leq 20$   $\mu$ M, thereby confirming the utility of the compounds of the present invention as effective HIV inhibitors.

15 Protein Binding and Mutant Resistance

In order to characterize NNRTI analogs for their clinical efficacy potential the effect of plasma proteins on antiviral potency and measurements of antiviral potency against wild type and mutant variants of HIV which carry amino acid changes in the known binding site for NNRTIs were examined. The rationale for this testing strategy is two fold:

1. Many drugs are extensively bound to plasma proteins. Although the binding affinity for most drugs for the major components of human plasma, namely, human serum albumin (HSA) or alpha-1-acid glycoprotein (AAG), is low, these major components are present in high concentration in the blood. Only free or unbound drug is available to cross the infected cell membrane for interaction with the target site (i.e., HIV-1 reverse transcriptase, HIV-1 RT). Therefore, the effect of added HSA+AAG on the antiviral potency in tissue culture more closely reflects the potency of a given compound in the clinical setting. The concentration of compound required for 90% inhibition of virus replication as measured in a sensitive viral RNA-based detection method is designated the IC<sub>90</sub>. The fold increase in apparent IC<sub>90</sub> for test compounds in the presence or added levels of HSA and AAG that reflect *in vivo* concentrations (45 mg/ml HSA, 1 mg/ml AAG) was then calculated. The lower

5 the fold increase, the more compound will be available to interact with the target site.

2. The combination of the high rate of virus replication in the infected individual and the poor fidelity of the viral RT results in the production of a quasi-species or mixtures of HIV species in the infected individual. These species will include a majority wild type species, but also mutant variants of HIV and the proportion of a given mutant will reflect its relative fitness and replication rate. Because mutant variants including mutants with changes in the amino acid sequence of the viral RT likely pre-exist in the infected individual's quasi-species, the overall potency observed in the clinical setting will reflect the ability of a drug to inhibit not only wild type HIV-1, but mutant variants as well. We thus have constructed, in a known genetic background, mutant variants of HIV-1 which carry amino acid substitutions at positions thought to be involved in NNRTI binding, and measured the ability of test compounds to inhibit replication of these mutant viruses. The concentration of compound required for 90% inhibition of virus replication as measured in a sensitive viral RNA-based detection method is designated the IC90. It is desirable to have a compound which has high activity against a variety of mutants.

### 30 Dosage and Formulation

The antiviral compounds of this invention can be administered as treatment for viral infections by any means that produces contact of the active agent with the agent's site of action, i.e., the viral reverse transcriptase, in the body of a mammal. They can be administered by any conventional means available for use in conjunction with pharmaceuticals, either as individual therapeutic agents or in a combination of therapeutic agents. They can be administered alone, but preferably are administered with a pharmaceutical carrier selected on the basis of the chosen

5 route of administration and standard pharmaceutical practice.

The dosage administered will, of course, vary depending upon known factors, such as the pharmacodynamic characteristics of the particular agent and its mode and  
10 route of administration; the age, health and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment; the frequency of treatment; and the effect desired. A daily dosage of active ingredient can be expected to be about 0.001 to about 1000 milligrams per  
15 kilogram of body weight, with the preferred dose being about 0.1 to about 30 mg/kg.

Dosage forms of compositions suitable for administration contain from about 1 mg to about 100 mg of active ingredient per unit. In these pharmaceutical  
20 compositions the active ingredient will ordinarily be present in an amount of about 0.5-95% by weight based on the total weight of the composition. The active ingredient can be administered orally in solid dosage forms, such as capsules, tablets and powders, or in liquid dosage forms,  
25 such as elixirs, syrups and suspensions. It can also be administered parenterally, in sterile liquid dosage forms.

Gelatin capsules contain the active ingredient and powdered carriers, such as lactose, starch, cellulose derivatives, magnesium stearate, stearic acid, and the like.  
30 Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained release products to provide for continuous release of medication over a period of hours. Compressed tablets can be sugar coated or film coated to mask any unpleasant taste  
35 and protect the tablet from the atmosphere, or enteric coated for selective disintegration in the gastrointestinal tract. Liquid dosage forms for oral administration can contain coloring and flavoring to increase patient acceptance.

5           In general, water, a suitable oil, saline, aqueous  
dextrose (glucose), and related sugar solutions and glycols  
such as propylene glycol or polyethylene glycols are  
suitable carriers for parenteral solutions. Solutions for  
parenteral administration preferably contain a water soluble  
10 salt of the active ingredient, suitable stabilizing agents,  
and if necessary, buffer substances. Antioxidizing agents  
such as sodium bisulfite, sodium sulfite, or ascorbic acid,  
either alone or combined, are suitable stabilizing agents.  
Also used are citric acid and its salts, and sodium EDTA.  
15 In addition, parenteral solutions can contain preservatives,  
such as benzalkonium chloride, methyl- or propyl-paraben and  
chlorobutanol. Suitable pharmaceutical carriers are  
described in *Remington's Pharmaceutical Sciences, supra*, a  
standard reference text in this field.  
20           Useful pharmaceutical dosage-forms for administration  
of the compounds of this invention can be illustrated as  
follows:

#### Capsules

25           A large number of unit capsules can be prepared by  
filling standard two-piece hard gelatin capsules each with  
100 mg of powdered active ingredient, 150 mg of lactose, 50  
mg of cellulose, and 6 mg magnesium stearic.

#### 30 Soft Gelatin Capsules

A mixture of active ingredient in a digestible oil such  
as soybean oil, cottonseed oil or olive oil can be prepared  
and injected by means of a positive displacement pump into  
gelatin to form soft gelatin capsules containing 100 mg of  
35 the active ingredient. The capsules should then be washed  
and dried.

#### Tablets

A large number of tablets can be prepared by  
40 conventional procedures so that the dosage unit is 100 mg of

5 active ingredient, 0.2 mg of colloidal silicon dioxide, 5 milligrams of magnesium stearate, 275 mg of microcrystalline cellulose, 11 mg of starch and 98.8 mg of lactose. Appropriate coatings may be applied to increase palatability or delay absorption.

10

### Suspension

An aqueous suspension can be prepared for oral administration so that each 5 mL contain 25 mg of finely divided active ingredient, 200 mg of sodium carboxymethyl  
15 cellulose, 5 mg of sodium benzoate, 1.0 g of sorbitol solution, U.S.P., and 0.025 mg of vanillin.

### Injectable

A parenteral composition suitable for administration by  
20 injection can be prepared by stirring 1.5% by weight of active ingredient in 10% by volume propylene glycol and water. The solution is sterilized by commonly used techniques.

### 25 Combination of components (a) and (b)

Each therapeutic agent component of this invention can independently be in any dosage form, such as those described above, and can also be administered in various ways, as described above. In the following description component (b)  
30 is to be understood to represent one or more agents as described previously. Thus, if components (a) and (b) are to be treated the same or independently, each agent of component (b) may also be treated the same or independently.

Components (a) and (b) of the present invention may be  
35 formulated together, in a single dosage unit (that is, combined together in one capsule, tablet, powder, or liquid, etc.) as a combination product. When component (a) and (b) are not formulated together in a single dosage unit, the component (a) may be administered at the same time as  
40 component (b) or in any order; for example component (a) of

5 this invention may be administered first, followed by  
administration of component (b), or they may be administered  
in the reverse order. If component (b) contains more than  
one agent, e.g., one RT inhibitor and one protease  
inhibitor, these agents may be administered together or in  
10 any order. When not administered at the same time,  
preferably the administration of component (a) and (b)  
occurs less than about one hour apart. Preferably, the  
route of administration of component (a) and (b) is oral.  
The terms oral agent, oral inhibitor, oral compound, or the  
15 like, as used herein, denote compounds which may be orally  
administered. Although it is preferable that component (a)  
and component (b) both be administered by the same route  
(that is, for example, both orally) or dosage form, if  
desired, they may each be administered by different routes  
20 (that is, for example, one component of the combination  
product may be administered orally, and another component  
may be administered intravenously) or dosage forms.

As is appreciated by a medical practitioner skilled in  
the art, the dosage of the combination therapy of the  
25 invention may vary depending upon various factors such as  
the pharmacodynamic characteristics of the particular agent  
and its mode and route of administration, the age, health  
and weight of the recipient, the nature and extent of the  
symptoms, the kind of concurrent treatment, the frequency of  
30 treatment, and the effect desired, as described above.

The proper dosage of components (a) and (b) of the  
present invention will be readily ascertainable by a medical  
practitioner skilled in the art, based upon the present  
disclosure. By way of general guidance, typically a daily  
35 dosage may be about 100 milligrams to about 1.5 grams of  
each component. If component (b) represents more than one  
compound, then typically a daily dosage may be about 100  
milligrams to about 1.5 grams of each agent of component  
(b). By way of general guidance, when the compounds of  
40 component (a) and component (b) are administered in

5 combination, the dosage amount of each component may be reduced by about 70-80% relative to the usual dosage of the component when it is administered alone as a single agent for the treatment of HIV infection, in view of the synergistic effect of the combination.

10 The combination products of this invention may be formulated such that, although the active ingredients are combined in a single dosage unit, the physical contact between the active ingredients is minimized. In order to minimize contact, for example, where the product is orally  
15 administered, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the  
20 gastrointestinal tract such that one of these components is not released in the stomach but rather is released in the intestines. Another embodiment of this invention where oral administration is desired provides for a combination product wherein one of the active ingredients is coated with a  
25 sustained-release material which effects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients. Furthermore, the sustained-released component can be additionally enteric coated such that the release of  
30 this component occurs only in the intestine. Still another approach would involve the formulation of a combination product in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a low-  
35 viscosity grade of hydroxypropyl methylcellulose or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to form an additional barrier to interaction with the other component. In each formulation wherein contact is  
40 prevented between components (a) and (b) via a coating or

5 some other material, contact may also be prevented between the individual agents of component (b).

Dosage forms of the combination products of the present invention wherein one active ingredient is enteric coated can be in the form of tablets such that the enteric coated component and the other active ingredient are blended together and then compressed into a tablet or such that the enteric coated component is compressed into one tablet layer and the other active ingredient is compressed into an additional layer. Optionally, in order to further separate the two layers, one or more placebo layers may be present such that the placebo layer is between the layers of active ingredients. In addition, dosage forms of the present invention can be in the form of capsules wherein one active ingredient is compressed into a tablet or in the form of a plurality of microtablets, particles, granules or non-perils, which are then enteric coated. These enteric coated microtablets, particles, granules or non-perils are then placed into a capsule or compressed into a capsule along with a granulation of the other active ingredient.

25 These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time or concurrently by the same manner, will be readily apparent to those skilled in the art, based on the present disclosure.

Pharmaceutical kits useful for the treatment of HIV infection, which comprise a therapeutically effective amount of a pharmaceutical composition comprising a compound of component (a) and one or more compounds of component (b), in one or more sterile containers, are also within the ambit of the present invention. Sterilization of the container may be carried out using conventional sterilization methodology well known to those skilled in the art. Component (a) and component (b) may be in the same sterile container or in

5 separate sterile containers. The sterile containers of  
materials may comprise separate containers, or one or more  
multi-part containers, as desired. Component (a) and  
component (b), may be separate, or physically combined into  
a single dosage form or unit as described above. Such kits  
10 may further include, if desired, one or more of various  
conventional pharmaceutical kit components, such as for  
example, one or more pharmaceutically acceptable carriers,  
additional vials for mixing the components, etc., as will be  
readily apparent to those skilled in the art. Instructions,  
15 either as inserts or as labels, indicating quantities of the  
components to be administered, guidelines for  
administration, and/or guidelines for mixing the components,  
may also be included in the kit.

Obviously, numerous modifications and variations of the  
20 present invention are possible in light of the above  
teachings. It is therefore to be understood that within the  
scope of the appended claims, the invention may be practiced  
otherwise than as specifically described herein.

## 5 WHAT IS CLAIMED:

1. A compound of formula I:

I

10

or a stereoisomer or pharmaceutically acceptable salt form thereof, wherein:

A is O or S;

15

B is selected from O, S, and NR<sup>8</sup>;

W is N or CR<sup>3</sup>;

20 X is N or CR<sup>3a</sup>;

Y is N or CR<sup>3b</sup>;

Z is N or CR<sup>3c</sup>;

25

provided that if two of W, X, Y, and Z are N, then the remaining are other than N;

30 R<sup>1</sup> is selected from the group C<sub>1-3</sub> alkyl substituted with 0-7 halogen and cyclopropyl;

R<sup>2</sup> is selected from the group -R<sup>2c</sup>, -OR<sup>2c</sup>, -OCHR<sup>2a</sup>R<sup>2b</sup>,  
 -OCH<sub>2</sub>CHR<sup>2a</sup>R<sup>2b</sup>, -O(CH<sub>2</sub>)<sub>2</sub>CHR<sup>2a</sup>R<sup>2b</sup>, -OCHR<sup>2a</sup>C=C-R<sup>2b</sup>,

group CH<sub>3</sub>, -OH, OCH<sub>3</sub>, OCF<sub>3</sub>, F, Cl, and -NR<sup>5</sup>R<sup>5a</sup>;

20 R<sup>4</sup> is selected from the group Cl, F, CH<sub>3</sub>, CH<sub>2</sub>CH<sub>3</sub>, cyclopropyl  
substituted with 0-1 R<sup>3e</sup>, 1-methyl-cyclopropyl  
substituted with 0-1 R<sup>3e</sup>, cyclobutyl substituted with  
0-1 R<sup>3e</sup>, phenyl substituted with 0-2 R<sup>3e</sup>, and a 5-6  
membered heterocyclic group containing 1-3 heteroatoms  
25 selected from the group O, N, and S, substituted with  
0-1 R<sup>3e</sup>, wherein the heterocyclic group is selected from  
the group 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-furanyl,  
3-furanyl, 2-thienyl, 3-thienyl, 2-oxazolyl,  
2-thiazolyl, 4-isoxazolyl, and 2-imidazolyl;

30 R<sup>5</sup> and R<sup>5a</sup> are independently selected from the group H, CH<sub>3</sub>  
and C<sub>2</sub>H<sub>5</sub>;

R<sup>6</sup> is selected from the group H, OH, CH<sub>3</sub>, C<sub>2</sub>H<sub>5</sub>, OCH<sub>3</sub>, OC<sub>2</sub>H<sub>5</sub>,  
35 and NR<sup>5</sup>R<sup>5a</sup>;

R<sup>7</sup> is selected from the group CH<sub>3</sub>, C<sub>2</sub>H<sub>5</sub>, OCH<sub>3</sub>, and OC<sub>2</sub>H<sub>5</sub>;  
and,

5

$R^8$  is selected from the group H, cyclopropyl, and  $C_2H_5$ .

5. A compound according to Claim 4, wherein the compound  
10 is of formula Ia

- 15 6. A compound according to Claim 4, wherein the compound  
is of formula Ib:

20

7. A compound according to Claim 1, wherein the compound  
is selected from the group:

25 7-Chloro-5-(2-cyclopropylethynyl)-1,5-dihydro-5-  
(trifluoromethyl)-1,3-benzodiazepin-2-one;

6,7-difluoro-5-(2-cyclopropylethynyl)-1,5-dihydro-5-  
(trifluoromethyl)-1,3-benzodiazepin-2-one;

30 7-Chloro-5-(2-cyclopropylethenyl)-1,5-dihydro-5-  
(trifluoromethyl)-1,3-benzodiazepin-2-one;

- 40 or a pharmaceutically acceptable salt form thereof.

10. A pharmaceutical composition comprising a  
45 pharmaceutically acceptable carrier and a therapeutically  
effective amount of a compound according to Claim 1, 2, 3,  
4, 5, 6, 7, 8, or 9 or pharmaceutically acceptable salt form  
thereof.

50

- 5 11. A method of treating HIV infection which comprises administering to a host in need of such treatment a therapeutically effective amount of a compound according to Claim 1, 2, 3, 4, 5, 6, 7, 8, or 9 or pharmaceutically acceptable salt form thereof.

10

12. A method of treating HIV infection which comprises administering, in combination, to a host in need thereof a therapeutically effective amount of:

- 15 (a) a compound according to Claim 1, 2, 3, 4, 5, 6, 7, 8, or 9; and,

- (b) at least one compound selected from the group consisting of HIV reverse transcriptase inhibitors and HIV protease inhibitors.

20

13. A method according to Claim 10, wherein the reverse transcriptase inhibitor is selected from the group AZT, ddC, ddI, d4T, 3TC, DPC082, DPC083, DPC961, DPC963, AG1549  
25 delavirdine, efavirenz, nevirapine, Ro 18,893, trovirdine, MKC-442, HBY 097, ACT, UC-781, UC-782, RD4-2025, and MEN 10979, and the protease inhibitor is selected from the group saquinavir, ritonavir, indinavir, amprenavir, nelfinavir, palinavir, BMS-232623, GS3333, KNI-413, KNI-272, LG-71350,  
30 CGP-61755, PD 173606, PD 177298, PD 178390, PD 178392, U-140690, and ABT-378.

14. A method according to Claim 11, wherein the reverse  
35 transcriptase inhibitor is selected from the group AZT, efavirenz, and 3TC and the protease inhibitor is selected from the group saquinavir, ritonavir, nelfinavir, and indinavir.

40

- 5 15. A method according to Claim 12 wherein the reverse transcriptase inhibitor is AZT.
16. A method according to Claim 12, wherein the protease  
10 inhibitor is indinavir.
17. A pharmaceutical kit useful for the treatment of HIV infection, which comprises a therapeutically effective  
15 amount of:
- (a) a compound according to Claim 1, 2, 3, 4, 5, 6, 7, 8, or 9 or a pharmaceutically acceptable salt form thereof; and,
  - (b) at least one compound selected from the group  
20 consisting of HIV reverse transcriptase inhibitors and HIV protease inhibitors, in one or more sterile containers.
18. A compound according to Claim 1, 2, 3, 4, 5, 6, 7, 8,  
25 or 9 or pharmaceutically acceptable salt forms thereof for use in therapy.
19. Use of compounds according to Claim 1, 2, 3, 4, 5, 6,  
30 7, 8, or 9 or pharmaceutically acceptable salt forms thereof for the manufacture of a medicament for the treatment of HIV.

### \* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 99/13872

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 11-16 and 19  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claims 11-16 and 19 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
